A CASE

*948. -1882

OF

UNILATERAL UTERUS

WITH A

SOLITARY KIDNEY HAVING TWO URETERS;

EXHIBITED AT THE

*Aberdeen, Banff, and Kincardine Branch of the British Medical
Association, 5th February, 1879.*

AND AT THE

Obstetrical Society of London, 5th March, 1879.

BY

FRANCIS OGSTON, JUN., M.D.,

LECTURER ON TOXICOLOGY, AND ASSISTANT TO THE PROFESSOR OF MEDICAL
JURISPRUDENCE IN THE UNIVERSITY OF ABERDEEN.

ABERDEEN: A. KING & COMPANY.

1879.

C

DESCRIPTION ACCOMPANYING PREPARATIONS.

The UTERUS had only its right half developed ; its left half, left fallopian tube, left ovary, and left broad ligament being wanting.

The RIGHT KIDNEY had two ureters, the upper, which was imperforate, opening into a cyst with bony plates in its walls, and terminating in the usual position to the *left* side of the bladder ; the *right* (lower) ureter running the usual course.

The kidney lay completely on the right side of the spinal column.

The LEFT KIDNEY was absent.

The LEFT SUPRA-RENAL CAPSULE was found at the position it usually occupies ; the *right* one at the upper end of the double kidney.

The body otherwise, the pelvis, and the external genitals were normally developed.
